Thomas Jefferson High School for Science and Technology, Alexandria, VA

Current devices geared towards the deaf and hard of hearing, such as hearing aids, struggle to localize and transmit sounds to those with severe hearing impairments. Advanced devices, like cochlear implants, are invasive and cost \$30,000 to \$50,000. Devices that classify sounds, such as home alert systems, are not suited for mobile use and recognize a limited number of noises. Our goal was to convey the directionality, pitch, amplitude, sound classification, and speech recognition of multiple sound sources to those with hearing impairments through a low-cost device. We localized sounds with the SRP-PHAT-HSDA algorithm calculated on incoming audio captured by a 6-microphone array. We separated sounds through Geometric Source Separation (GSS) and beamforming, allowing us to isolate 4 audio sources. We classified each source in real-time using a stacked generalization ensemble trained on an augmented audio dataset. Background noise is filtered through dynamic noise reduction for each source. The direction along with filtered amplitude and frequency are transmitted to the user through vibration motors in a wearable device worn around the shoulders while classification and speech recognition are displayed on a watchOS app. SoundScape can reliably localize four sounds under 15.49 degrees of error, classify sounds with 93.4% accuracy, and operate under 0.2 seconds of latency. The entire device costs \$60 to manufacture with inexpensive TPU filament. SoundScape is the first device assistive listening device to separate, localize, and classify multiple sound sources with the potential to protect 466 million people with hearing loss worldwide.

1. In this research project, the student directly handled, manipulated, or interacted with (check ALL that apply):

<input type="checkbox"/> human participants	<input type="checkbox"/> potentially hazardous biological agents
<input type="checkbox"/> vertebrate animals	<input type="checkbox"/> microorganisms <input type="checkbox"/> rDNA <input type="checkbox"/> tissue

2. I/we worked or used equipment in a regulated research institution or industrial setting (Form 1C): YES NO

3. This project is a continuation of previous research (Form 7): YES NO

4. My display board includes non-published photographs/visual depictions of humans (other than myself): YES NO

5. This abstract describes only procedures performed by me/us, reflects my/our own independent research, and represents one year's work only: YES NO

6. I/we hereby certify that the abstract and responses to the above statements are correct and properly reflect my/our own work. YES NO

The stamp or embossed seal attests that this project is in compliance with all federal and state laws and regulations and that all appropriate reviews and approvals have been obtained including the final clearance by the Scientific Review Committee.
